

Move hyphen to beginning

Move Hyphen to Beginning: Moving the hyphen to the beginning refers to the task of repositioning a hyphen in a given string so that it appears at the beginning. For example, transforming "face-prep" into "-faceprep".

```
public class MoveHyphenToBeginning {  
    public static void main(String[] args) {  
        String originalString = "face-prep";  
        String transformedString = moveHyphenToBeginning(originalString);  
        System.out.println(transformedString);  
    }  
  
    public static String moveHyphenToBeginning(String string) {  
        if (string.contains("-")) {  
            int hyphenIndex = string.indexOf("-");  
            return "-" + string.substring(0, hyphenIndex) + string.substring(hyphenIndex + 1);  
        } else {  
            return string;  
        }  
    }  
}
```

THANK YOU
