

Problem Solving Using Python (CSE1012)

Dr. Abdul Kayom, Assistant Professor, SENSE

Agenda / Contents

01 Branching Statements

02 IF-ELSE

03 Nested IF-ELSE

04

05

If Statement Example

- # Determine the character entered by user

If Statement Example

- # Determine the character entered by user

```
char= input("Press any Key: ")
```

```
if(char.isalpha()):
```

```
    print("The User has entered a character")
```

```
if(char.isdigit()):
```

```
    print("The User has entered a digit")
```

```
if(char.isspace()):
```

```
    print("The User has entered a white space")
```

Example: Radius of a circle

- Write a program that takes the area of a circle as input and computes and outputs its radius.

Example: Radius of a circle

```
import math
area=float(input("Enter the Area: "))
if area>0:
    radius=math.sqrt(area/math.pi)
    print("The radius is: ",radius)
else:
    print("The Area must be Positive")
```

Example: Perimeter & Area of Triangle

- Write a program that takes the sides of a triangle and computes its perimeter and area and outputs it.

Thank You
